education for health

Hypertension kills silently. It can result from under-diagnosis, under-treatment and poor blood pressure control. It is critical that primary care health professionals take decisive action to save lives, learning how to identify, assess and manage hypertension.

Education for Health is delighted to be able to launch significant new education which focuses on essential hypertension: identifying it, assessing it, and helping your patients to understand it. It encourages you to examine real management in the real world.

Based on the very latest evidence and relentlessly practical you can choose from the new, accredited, four month diploma level course which will form the basis for informed practice and patient dialogue. Alternatively, choose the new one day short course to kick start your ability to provide optimum care for patients - very timely since the approaching cold weather increases the risk of stroke for patients with hypertension.

- Based on the latest national guidelines including NICE and JBS2
- Fully up to date with the latest QOF targets
- Written by nationally recognised clinicians and delivered by expert lecturer practitioners.

Enrolling now in Warwick or can be delivered in your locality
